

Cybersecurity Services

Advanced Real-Time Threat Protection

Data compromise is a constant threat. A security breach can happen any time, day or night, **24/7/365**.

Until recently, a **solid** security strategy was only available to large businesses with big budgets. The little guy was left to fend off cyberthreats with boxed software that was difficult to use and provided little protection.

Managed Security Services

STL's **Security Operations Center (SOC)** now offers **proactive, real-time threat monitoring and management** to small, medium, AND large businesses. Our tiered security operations services are designed to fit the **needs** and **budget** of your business, **no matter the size**.

Our **cybersecurity experts** proactively research and identify the latest threats and provide defensive solutions that keep your data **safe, secure** and **reliable**.

No matter the industry, we can explore systems and help close loopholes to ensure coverage from stringent compliance and audit requirements of each of the following: **SOC2, Type-2 HITRUST CSF*, HIPAA, PCI DSS**, and **SSAE-16** reporting.

We leverage a combination of **network perimeter defense, endpoint security, vulnerability detection, extensive log analytics, and customizable reporting**.

As a trusted **Fortinet® Gold Partner**, STL utilizes the **FortiGuard Indicator of Compromise (IOC)** Automated Breach Defense system.

The IOC **continuously monitors** your network for hidden vulnerabilities, persistent attacks, and advanced threats.

Advanced features such as **Mobile Access, Instant Feedback** and a **Real-Time Threat Map** provide customers with 24-hour accessibility to the real-time status of their network.

Other features found in our solutions include:

- Real-time detection and mitigation of malware infections,
- Network intrusion detection and prevention,
- Disruption of botnet command and control activity,
- Customizable web-content, network application and geolocation filtering,
- SSL traffic inspection,
- Vulnerability detection and exploit mitigation,
- Notifications and customizable reports on;
 - Malicious activity,
 - System anomalies,
 - New software installations,
 - New user profiles,
 - Access control changes,
 - Unusual logins,
 - New devices on restricted networks,
 - Unauthorized wireless connections,
 - Unauthorized access to CDE/ePHI,
 - and much more.
